

SSH

key gen / key auth:

local

key ---- public ----> server

..... private

1) `ssh-keygen -t ed25519 -C "user@domain"`

vs

Private keys go to `..../.ssh/id-ed25519`

but public are the same "w/ .pub
`/id-ed25519.pub`

2) Upload the key:

local | `ssh-copy-id [user]@[domain]` └ full

connect as usual

run

`ssh-add -k ~/.ssh/id-ed25519`

then

`ssh-add -l` to list

Expand : boot mount

if a drive is mounted @ boot by fdisk
& samba like w/ a
network attached drive
then the device cannot boot until
the disk is found

Must be attached

★ ☆ need to remove cd drive from
the samba file
read nas guide

git

git sparse for sifefolder

must add an automated
cron task to pull
